CredShields

Smart Contract Audit

Dec 4th, 2023 • CONFIDENTIAL

Description

This document details the process and result of the RDGX Smart Contract audit performed by CredShields Technologies PTE. LTD. on behalf of RDGX Token between Nov 30th, 2023, and Dec 2nd, 2023. A retest was performed on Dec 3rd, 2023.

RDGX Token

Table of Contents

1. Executive Summary

RDGX Token engaged CredShields to perform a smart contract audit from Nov 30th, 2023, to Dec 2nd, 2023. During this timeframe, Three (3)vulnerabilities were identified. **A retest was performed on Dec 3rd, 2023, and all the bugs have been addressed.**

During the audit, Zero (0) vulnerabilities were found with a severity rating of either High or Critical. These vulnerabilities represent the greatest immediate risk to "RDGX Token" and should be prioritized for remediation, and fortunately, none were found.

The table below shows the in-scope assets and a breakdown of findings by severity per asset. Section 2.3 contains more information on how severity is calculated.

Assets in Scope	Critical	High	Medium	Low	info	Gas	Σ
RDGX Smart Contract	0	0	0	1	2	0	**3**
	0	**0**	**0**	**1**	**2**	**0**	**3**

Table: Vulnerabilities Per Asset in Scope

The CredShields team conducted the security audit to focus on identifying vulnerabilities in RDGX Smart Contract's scope during the testing window while abiding by the policies set forth by RDGX Smart Contract's team.

State of Security

To maintain a robust security posture, it is essential to continuously review and improve upon current security processes. Utilizing CredShields' continuous audit feature allows both RDGX Token's internal security and development teams to not only identify specific vulnerabilities but also gain a deeper understanding of the current security threat landscape.

To ensure that vulnerabilities are not introduced when new features are added, or code is refactored, we recommend conducting regular security assessments. Additionally, by analyzing the root cause of resolved vulnerabilities, the internal teams at RDGX Token can implement both manual and automated procedures to eliminate entire classes of vulnerabilities in the future. By taking a proactive approach, RDGX Token can future-proof its security posture and protect its assets.

2. Methodology

RDGX Token engaged CredShields to perform an RDGX Token Smart Contract audit. The following sections cover how the engagement was put together and executed.

2.1 Preparation phase

The CredShields team meticulously reviewed all provided documents and comments in the smart contract code to gain a thorough understanding of the contract's features and functionalities. They meticulously examined all functions and created a mind map to systematically identify potential security vulnerabilities, prioritizing those that were more critical and business-sensitive for the refactored code. To confirm their findings, the team deployed a self-hosted version of the smart contract and performed verifications and validations during the audit phase.

A testing window from Nov 30th, 2023, to Dec 2nd, 2023, was agreed upon during the preparation phase.

2.1.1 Scope

During the preparation phase, the following scope for the engagement was agreed upon:

IN SCOPE ASSETS
https://etherscan.io/address/0xe4cbd3ff926796e6e95e81f1268258418a0c5cda#code

Table: List of Files in Scope

2.1.2 Documentation

Documentation was not required as the code was self-sufficient for understanding the project.

2.1.3 Audit Goals

CredShields uses both in-house tools and manual methods for comprehensive smart contract security auditing. The majority of the audit is done by manually reviewing the contract source code, following SWC registry standards, and an extended industry standard self-developed checklist. The team places emphasis on understanding core concepts, preparing test cases, and evaluating business logic for potential vulnerabilities.

2.2 Retesting phase

RDGX Token is actively partnering with CredShields to validate the remediations implemented towards the discovered vulnerabilities.

2.3 Vulnerability classification and severity

CredShields follows OWASP's Risk Rating Methodology to determine the risk associated with discovered vulnerabilities. This approach considers two factors - Likelihood and Impact - which are evaluated with three possible values - **Low**, **Medium**, and **High**, based on factors such as Threat agents, Vulnerability factors, Technical and Business Impacts. The overall severity of the risk is calculated by combining the likelihood and impact estimates.

Overall Risk Severity				
Impact	HIGH	Medium	High	Critical
	MEDIUM	Low	Medium	High
	LOW	Note	Low	Medium
		LOW	MEDIUM	HIGH
	Likelihood			

Overall, the categories can be defined as described below -

1. **Informational**

   We prioritize technical excellence and pay attention to detail in our coding practices. Our guidelines, standards, and best practices help ensure software stability and reliability. Informational vulnerabilities are opportunities for improvement and do

not pose a direct risk to the contract. Code maintainers should use their own judgment on whether to address them.

2. **Low**

   Low-risk vulnerabilities are those that either have a small impact or can't be exploited repeatedly or those the client considers insignificant based on their specific business circumstances.

3. **Medium**

   Medium-severity vulnerabilities are those caused by weak or flawed logic in the code and can lead to exfiltration or modification of private user information. These vulnerabilities can harm the client's reputation under certain conditions and should be fixed within a specified timeframe.

4. **High**

   High-severity vulnerabilities pose a significant risk to the Smart Contract and the organization. They can result in the loss of funds for some users, may or may not require specific conditions, and are more complex to exploit. These vulnerabilities can harm the client's reputation and should be fixed immediately.

5. **Critical**

   Critical issues are directly exploitable bugs or security vulnerabilities that do not require specific conditions. They often result in the loss of funds and Ether from Smart Contracts or users and put sensitive user information at risk of compromise

or modification. The client's reputation and financial stability will be severely impacted if these issues are not addressed immediately.

6. **Gas**

   To address the risk and volatility of smart contracts and the use of gas as a method of payment, CredShields has introduced a "Gas" severity category. This category deals with optimizing code and refactoring to conserve gas.

2.4 CredShields staff

The following individual at CredShields managed this engagement and produced this report:

- **Shashank, Co-founder CredShields**
    - shashank@CredShields.com

Please feel free to contact this individual with any questions or concerns you have around the engagement or this document.

3. Findings

This chapter contains the results of the security assessment. Findings are sorted by their severity and grouped by the asset and SWC classification. Each asset section will include a summary. The table in the executive summary contains the total number of identified security vulnerabilities per asset per risk indication.

3.1 Findings Overview

3.1.1 Vulnerability Summary

During the security assessment, Three (3)security vulnerabilities were identified in the asset.

VULNERABILITY TITLE	SEVERITY	SWC | Vulnerability Type
Outdated Pragma version	Low	Outdated Pragma
Name Mapping Parameters	Informational	Code Optimization
Missing Zero Address Validations	Informational	Missing Input Validation

Table: Findings in Smart Contracts

3.1.2 Findings Summary

SWC ID	SWC Checklist	Test Result	Notes
SWC-100	Function Default Visibility	Not Vulnerable	Not applicable after v0.5.X (Currently using solidity v >= 0.8.6)
SWC-101	Integer Overflow and Underflow	Not Vulnerable	The issue persists in versions before v0.8.X.
SWC-102	Outdated Compiler Version	Not Vulnerable	Version 0^.8.0 and above is used
SWC-103	Floating Pragma	Not Vulnerable	Contract uses floating pragma
SWC-104	Unchecked Call Return Value	Not Vulnerable	call() is not used
SWC-105	Unprotected Ether Withdrawal	Not Vulnerable	Appropriate function modifiers and require validations are used on sensitive functions that allow token or ether withdrawal.
SWC-106	Unprotected SELFDESTRUCT Instruction	Not Vulnerable	selfdestruct() is not used anywhere
SWC-107	Reentrancy	Not Vulnerable	No notable functions were vulnerable to it.
SWC-108	State Variable Default Visibility	Not Vulnerable	Not Vulnerable
SWC-109	Uninitialized Storage Pointer	Not Vulnerable	Not vulnerable after compiler version, v0.5.0

SWC-110	Assert Violation	Not Vulnerable	Asserts are not in use.
SWC-111	Use of Deprecated Solidity Functions	Not Vulnerable	None of the deprecated functions like block.blockhash(), msg.gas, throw, sha3(), callcode(), suicide() are in use
SWC-112	Delegatecall to Untrusted Callee	Not Vulnerable	Not Vulnerable.
SWC-113	DoS with Failed Call	Not Vulnerable	No such function was found.
SWC-114	Transaction Order Dependence	Not Vulnerable	Not Vulnerable.
SWC-115	Authorization through tx.origin	Not Vulnerable	tx.origin is not used anywhere in the code
SWC-116	Block values as a proxy for time	Not Vulnerable	Block.timestamp is not used
SWC-117	Signature Malleability	Not Vulnerable	Not used anywhere
SWC-118	Incorrect Constructor Name	Not Vulnerable	All the constructors are created using the constructor keyword rather than functions.
SWC-119	Shadowing State Variables	Not Vulnerable	Not applicable as this won't work during compile time after version 0.6.0
SWC-120	Weak Sources of Randomness from Chain Attributes	Not Vulnerable	Random generators are not used.
SWC-121	Missing Protection against Signature Replay Attacks	Not Vulnerable	No such scenario was found

SWC-122	Lack of Proper Signature Verification	Not Vulnerable	Not used anywhere
SWC-123	Requirement Violation	Not Vulnerable	Not vulnerable
SWC-124	Write to Arbitrary Storage Location	Not Vulnerable	No such scenario was found
SWC-125	Incorrect Inheritance Order	Not Vulnerable	No such scenario was found
SWC-126	Insufficient Gas Griefing	Not Vulnerable	No such scenario was found
SWC-127	Arbitrary Jump with Function Type Variable	Not Vulnerable	Jump is not used.
SWC-128	DoS With Block Gas Limit	Not Vulnerable	Not Vulnerable.
SWC-129	Typographical Error	Not Vulnerable	No such scenario was found
SWC-130	Right-To-Left-Override control character (U+202E)	Not Vulnerable	No such scenario was found
SWC-131	Presence of unused variables	Not Vulnerable	No such scenario was found
SWC-132	Unexpected Ether balance	Not Vulnerable	No such scenario was found
SWC-133	Hash Collisions With Multiple Variable Length Arguments	Not Vulnerable	abi.encodePacked() or other functions are not used.
SWC-134	Message call with hardcoded gas amount	Not Vulnerable	Not used anywhere in the code
SWC-135	Code With No Effects	Not Vulnerable	No such scenario was found
SWC-136	Unencrypted Private Data On-Chain	Not Vulnerable	No such scenario was found

4. Remediation Status

RDGX Token is actively partnering with CredShields from this engagement to validate the discovered vulnerabilities' remediations. **A retest was performed on Dec 3rd, 2023, and all the issues have been addressed.**

Also, the table shows the remediation status of each finding.

VULNERABILITY TITLE	SEVERITY	REMEDIATION STATUS
Outdated Pragma version	Low	**Won't Fix [02/12/2023]**
Name Mapping Parameters	Informational	**Won't Fix [02/12/2023]**
Missing Zero Address Validations	Informational	**Won't Fix [02/12/2023]**

Table: Summary of findings and status of remediation

5. Bug Reports

Bug ID #1

Outdated Pragma version

Vulnerability Type
Outdated Pragma

Severity
Low

Description
Using an outdated compiler version can be problematic, especially if there are publicly disclosed bugs and issues that affect the current compiler version.
The contracts found in the repository were allowing an old compiler version to be used, i.e., 0.8.21.

Affected Code

- https://etherscan.io/address/0xe4cbd3ff926796e6e95e81f1268258418a0c5cda#code#F17#L3

Impacts
If the smart contract gets compiled and deployed with an older or too recent version of the solidity compiler, there's a chance that it may get compromised due to the bugs present in the older versions or unidentified exploits in the new versions.
Incompatibility issues may also arise if the contract code does not support features in other compiler versions, therefore, breaking the logic.
The likelihood of exploitation is really low therefore this is only Low severity.

Remediation

Keep the compiler versions updated in all the smart contract files. Do not allow floating pragmas anywhere. It is suggested to use the 0.8.22 pragma version which is stable and not too recent.
Reference: https://swcregistry.io/docs/SWC-103

Retest
Since this is not exploitable this won't be fixed. The CredShields team agrees as well.

Bug ID #2

Name Mapping Parameters

Vulnerability Type
Code Optimization

Severity
Informational

Description
In Solidity version 0.8.18 and later, a new feature was introduced to name mapping parameters. This enhancement allows developers to provide meaningful names for mappings, making the code more self-descriptive and easier to understand. Before this update, mappings were anonymous and required separate documentation or comments to explain their purpose. By naming mapping parameters, Solidity aims to improve code readability, maintainability, and overall developer experience.

Affected Code

- https://etherscan.io/address/0xe4cbd3ff926796e6e95e81f1268258418a0c5cda#code#F17#L48

Impacts
Named mapping parameters provide clear and concise descriptions of their purposes, reducing the need for additional comments or documentation to understand the role of each mapping in the contract. The named mappings enable developers to write more self-explanatory code, making it easier for other team members and auditors to understand the intention behind each mapping and its usage in the contract.

Remediation
It is recommended to name the mapping parameters if Solidity 0.8.18 and above is used.

Retest
Since this is not exploitable this won't be fixed. The CredShields team agrees as well.

Bug ID #3

Missing Zero Address Validations

Vulnerability Type
Missing Input Validation

Severity
Informational

Description:
The contracts were found to be setting new addresses without proper validations for zero addresses.
Address type parameters should include a zero-address check otherwise contract functionality may become inaccessible or tokens burned forever.
Depending on the logic of the contract, this could prove fatal and the users or the contracts could lose their funds, or the ownership of the contract could be lost forever.
No such cases were found in this case.

Affected Variables and Line Numbers

- https://etherscan.io/address/0xe4cbd3ff926796e6e95e81f1268258418a0c5cda#code#F17#L179
- https://etherscan.io/address/0xe4cbd3ff926796e6e95e81f1268258418a0c5cda#code#F17#L158

Impacts
If address type parameters do not include a zero-address check, contract functionality may become unavailable or tokens may be burned permanently. In this case, since this is missing in the function to add denylist addresses, it won't have any impact since it affects only the token transfer functionality.

Remediation
Add a zero address validation to all the functions where addresses are being set.

Retest

Since this is not exploitable this won't be fixed. The CredShields team agrees as well.
